AyanoERP Finance

Billing and Payment System – User Guide

Version 1.0 · November 7, 2026

1. What this system does

It turns every confirmed customer order into an invoice, lets Finance staff record full or partial payments against it, and tracks whether each invoice is Pending or Paid. The dashboard shows how much has been collected and how much is still to be collected. Payments are recorded by hand; there is no online payment gateway.

2. Starting the system

Open a terminal in the billing-system folder.

- Install once: npm install
- Everyday use (development): npm run dev, then open http://localhost:5173
- Single-server mode: npm run build, then npm start, then open http://127.0.0.1:3000

The system works offline. Data is kept in one file: backend/data/billing.db. Back it up by copying that file while the server is stopped.

3. Signing in

The system ships with no default login. On the very first visit you see a Create account form: choose a username (3+ characters) and a password (8+ characters). This account has the Finance role and can record payments. After that, the same page is a normal sign-in. Too many failed attempts temporarily blocks sign-in for 15 minutes. Use Sign out in the sidebar when you finish.

4. Daily workflow

1. Orders !’ New order: pick a customer, a product and a quantity, then Create. (This page stands in for Sales Management.)
2. Click Confirm on the order. An invoice such as INV-2026-0001 is generated automatically with status Pending. Each order can have only one invoice.
3. Invoices !’ open the invoice !’ Record Payment. Enter the amount, method, reference number and date, then Save.
4. The balance and status update immediately. When the balance reaches PHP 0.00 the status becomes Paid; until then it stays Pending.

5. Screens

Screen	What you see	What you can do
Dashboard	Total invoices, Paid, Pending, Total Collected, Total Receivable, latest invoices	Open an invoice
Invoices	Invoice no., order no., customer, date, total, paid, balance, status	Filter by status, search, view details
Invoice details	Customer info, order items, totals, full payment history	Record Payment, Print
Payments	Payment ID, invoice no., date, amount, method, reference, recorded by (newest first)	Search by invoice number or reference

Orders	All orders with status	Create an order, Confirm it

6. Recording a payment: the rules

- Amount must be greater than 0 and cannot exceed the invoice’s current balance (no overpayment).
- Payment method is required: Cash, Bank Transfer, E-Wallet or Card.
- A reference number is required for Bank Transfer, E-Wallet and Card. It is optional for Cash.
- The payment date cannot be in the future.
- Payments cannot be recorded on an invoice that is already Paid.
- Only users with the Finance role can record payments.
- Recorded payments cannot be edited or deleted, which keeps the payment history reliable for auditing.

7. Example: a PHP 5,000.00 invoice

Step	Result
Confirm order of PHP 5,000.00	Invoice created, balance PHP 5,000.00, status Pending
Pay PHP 2,000.00 by Cash	Paid PHP 2,000.00, balance PHP 3,000.00, status Pending
Pay PHP 3,000.00 by E-Wallet, ref EW-123	Balance PHP 0.00, status Paid
Try to pay PHP 6,000.00 on a PHP 5,000.00 balance	Rejected: amount exceeds balance
Try to pay anything on the Paid invoice	Rejected: invoice already paid

8. Troubleshooting

Problem	What to do
Page will not load	Check the server is running (npm run dev) and that you are using http://localhost:5173.
Port already in use	Another program is using port 3000 or 5173. Close it, or set PORT in backend/.env.
Cannot create an account	An account already exists. Sign in instead.
Forgot the password	Stop the server and delete backend/data/billing.db (and files starting billing.db-). This also erases all invoices and payments.
No Record Payment button	The invoice is already Paid, or your user is not a Finance user.
Signed out unexpectedly	Sessions expire after 8 hours of inactivity. Sign in again.
